Appendix C

Construction and Operational Health Risk Assessment

Kimley»Horn

MEMORANDUM

To:	Joseph Onyebuchi, Associate Planner, City of Burbank
From:	Noemi Wyss AICP, Kimley-Horn and Associates, Inc.
	Tanay Pradhan, Kimley-Horn and Associates, Inc.
Date:	August 14, 2025
Subject:	Burbank Soil Vapor Extraction System Upgrade Project
	Construction and Operation Health Risk Assessment

1.0 Purpose

The purpose of this Health Risk Assessment (HRA) is to prepare an update to a study performed in support of the prior adopted Environmental Impact Report (EIR) for the Soil Vapor Extraction (SVE) System located in the City of Burbank (City), California. The previous EIR was prepared in October 1995. Since the analysis and evaluation, new receptors are in the vicinity of the Project Site that may result in new potential health risks associated with Toxic Air Contaminants (TAC) including Diesel Particulate Matter (DPM) and Volatile Organic Compounds (VOC) resulting from the construction and operations of the SVE System Upgrade Project (Project). These new and existing receptors will be evaluated for lifetime risk from combined exposure during the construction and subsequent operation of the SVE System. This HRA was prepared in accordance with the requirements of the South Coast Air Quality Management District (SCAQMD) and guidance from the Office of Environmental Health Hazard Assessment (OEHHA) to determine if implementation of the Project would result in unacceptable health risks to the public.

2.0 Project Location and Description

Implementation of the Project would require construction activity at 1234 North Victory Place and within the parking lots of the adjacent Burbank Empire Center (1501 North Victory Place, 1800 West Empire Avenue, and 1301 North Victory Place); see **Figure 1: Regional Vicinity Map**. The Project Site is generally surrounded by commercial and industrial uses bounded between the Metrolink Antelope Valley Line railroad tracks to the south and North Victory Place to the north and east of the triangular plot of land; see **Figure 2: Local Vicinity Map**. The 1234 North Victory Place portion of the Project Site is currently improved with a building that contains the legacy soil vapor extraction (SVE) treatment system, and five dedicated parking spaces. The SVE well field is located within the parking lots of the Burbank Empire Center.

The Proposed Project would consist of four primary elements:

1) dismantling and removal of the existing legacy SVE treatment plant and associated structures;
2) installation of a new SVE treatment plant at 1234 Victory Place;
3) installation of 27 additional SVE wells beneath the Burbank Empire Center parking lots within the

SVE well field; and
4) installation of an underground piping network to connect the new wells to the proposed SVE treatment system.

The new SVE treatment system would be located on the northern portion of the SVE treatment plant property and would extract soil vapors containing concentrations of volatile organic compounds (VOCs) from beneath the SVE well field and treat the vapors prior to venting to the atmosphere.

The 27 additional SVE wells would be installed to develop a focused SVE network for targeted VOC mass removal in source areas VMP-3 and VMP-5. The proposed wells would be drilled to a maximum depth of 145 feet and would be connected to underground conveyance piping that would convey vapors from the proposed wells to the proposed SVE treatment system. All but three of the proposed wells would be within the SVE well field; three of the proposed wells surrounding the VMP-5 source area would be in the City's right-of-way (ROW) for North Victory Place to the north.

The proposed SVE treatment plant would be accessed via the existing driveway off North Victory Place located in the adjacent parcel west of the SVE treatment plant property . The Proposed Project would provide two parking places within the Project Site, for employees, visitors, and vendors performing periodic monitoring or other activities during operation of the SVE facility. The proposed SVE wells within the SVE well field would be accessed via the existing parking lots of the Burbank Empire Center.

Project construction is anticipated to start in early 2026 and conclude in the spring of 2027 (assumed to be up to 16 months). Project construction activities would consist of demolition of the existing legacy SVE treatment plant, Project Site grading, installation of new electrical infrastructure, and construction of the proposed SVE treatment system and associated wells and piping. Based on information provided by the applicant, construction of the proposed SVE Phase I C3 system would not overlap with construction of the proposed SVE wells and piping.

3.0 South Coast Air Quality Management District

The California Clean Air Act (CCAA) provides the SCAQMD with the authority to manage transportation activities at indirect sources and regulate stationary source emissions. Indirect sources of pollution are generated when minor sources collectively emit a substantial amount of pollution. An example of this would be the motor vehicles at an intersection, a mall, and on highways. As a State agency, CARB regulates motor vehicles and fuels for their emissions. CARB identified DPM as a TAC in 1998. Mobile sources (including trucks, buses, automobiles, trains, ships, and farm equipment) are by far the largest source of diesel emissions. The exhaust from diesel engines includes hundreds of different gaseous and particulate components, many of which are toxic. Diesel exhaust is composed of two phases, either gas or particulate – both contribute to the risk. The gas phase is composed of many of the urban TACs, such as acetaldehyde, acrolein, benzene, 1,3-butadiene, formaldehyde, and polycyclic aromatic hydrocarbons. The particulate phase has many different types that can be classified by size or composition. The sizes of diesel particulates of greatest health concern are fine and ultrafine particles. These particles may be composed

of elemental carbon with adsorbed compounds such as organics, sulfates, nitrates, metals, and other trace elements. Diesel exhaust is emitted from a broad range of on- and off-road diesel engines.

SCAQMD's New Source Review of Toxic Air Contaminants (Rule 1401) specifies limits for maximum individual cancer risk (MICR), cancer burden, and noncancer acute and chronic hazard index (HI) from new permit units, relocations, or modifications to existing permit units which emit TACs. The rule has been amended several times to change the list of regulated compounds (both additions and deletions). Rule 1401 was amended on June 5, 2015 to incorporate the most recent OEHHA Risk Assessment Guidelines for calculating health risks.

4.0 Potential Public Exposure

A sensitive receptor is defined as any residence including private homes, condominiums, apartments, and living quarters; schools, including preschools and daycare centers; health facilities such as hospitals, retirement homes, nursing homes, long term care hospitals, and hospices; prisons, dormitories, or similar live-in housing, where children, chronically ill individuals, or other sensitive persons could be exposed to TACs. Receptors include any areas where workers may be exposed. Chronic and cancer health risks are based on annual exposure. Thus, the following receptors were modeled for those impacts:

- Animal Shelter employee across North Victory Place, which includes outdoor and indoor exposures (indoor includes standard HVAC mitigation for particulate concentrations); conservatively modeled as 100 percent outdoor exposure.
- Walmart loading dock employee, adjacent to the SVE system facility, conservatively modeled as 100 percent outdoor exposure.
- Retail employees throughout the Burbank Empire Center, assuming 100 percent indoor exposure.
- Residential receptors are the nearest single-family residences, conservatively modeled as 100 percent outdoor exposure.

Acute non-carcinogenic health risks are based on peak hour of exposure. Thus, outdoor (unmitigated) receptors were modeled for all of the receptor locations discussed above, plus the sidewalk adjacent to the site on North Victory Place.

5.0 Construction Methodology

Construction would generate localized DPM emissions from the use of off-road diesel equipment required for grading and excavation, paving, and other construction activities. For construction activity, DPM is the primary TAC of concern. On-road diesel-powered haul trucks traveling to and from the construction area to deliver materials and equipment are less of a concern because they would not stay on the site for long durations. Diesel exhaust from construction equipment operating at the site potentially poses a health risk to nearby sensitive receptors. The closest sensitive receptors to the Project are residences located approximately 440 feet northeast.

Health-related risks associated with diesel-exhaust emissions are primarily linked to long-term exposure and the associated risk of contracting cancer. The use of diesel-powered construction equipment would be episodic and would occur throughout the Project site. Pursuant to Section 2485 and Section 2449 of Title 13 of the California Code of Regulations, idling of on- and off-road equipment is limited to no more than five minutes, which reduces nearby sensitive receptors' exposure to temporary and variable DPM emissions. Construction emissions rates for PM10 (DPM) were calculated from the California Emissions Estimator Model (CalEEMod) construction emissions modeling conducted for the Project.

Project construction was modeled to begin January 2026 with a construction duration of approximately 16 months and would include 2,570 tons of demolition materials, including the pavement and pipelines. Additionally, there would be approximately 314 cubic yards (cy) of soil material export during construction. The construction schedule is shown in **Table 1: Construction Schedule**.

Table 1: Construction Schedule

Phase Type	Start	End	Days
Demolition	1/1/2026	2/28/2026	42
Grading	3/1/2026	4/30/2026	44
Infrastructure Improvements	5/1/2026	6/30/2026	43
SVE Well Construction	7/1/2026	10/30/2026	88
Treatment Plant Construction	10/31/2026	4/30/2027	130

Source: Refer to Attachment A: Modeling Results.

PM10 exhaust construction emissions over the entire construction period were used to approximate construction DPM emissions. Dispersion modeling was performed using the American Meteorological Society/U.S. EPA Regulatory Model (AERMOD). AERMOD requires meteorological, traffic volumes, and vehicle emissions data. Meteorological data used in the HRA is discussed below. AERMOD provides concentrations in an isopleth to visually show the dispersion of the pollutant. All AERMOD assumptions, input data, and outputs are provided herein. Risk levels were calculated based on the SCAQMD OEHHA guidance document, Air Toxics Hot Spots Program Risk Assessment Guidelines, February 2015 (OEHHA 2015 Guidance).

The construction emission sources are modeled as line volume sources for on-site construction and off-site haul truck operations. Off-road construction equipment operating on-site and hauling trucks off-site were assigned a release height of 10.2 feet (3.11 meters) and a plume height of 20.4 feet (6.22 meters) based on a vehicle height of 12 feet (3.66 meters). The methodology used to determine release and plume heights was based on U.S. EPA guidance for vehicle volume sources.[1]

6.0 Operational Methodology

Operational Pollutants of Concern

[1] United States Environmental Protection Agency, Air Quality Dispersion Modeling – Preferred and Recommended Models, https://www.epa.gov/scram/air-quality-dispersion-modeling-preferred-and-recommended-models.

The primary pollutants of concern were derived from the results of the Soil Vapor Extraction Pilot Test Report for Source Area Removal Action and the OEHHA's 2009 Technical Support Document for Cancer Potency Factors. These pollutants were listed in the SVE Analytic Test Results and have a Cancer Potency Factor assigned to them by Appendix A of OEHHA's 2009 Technical Support Document for Cancer Potency Factors. These pollutants additionally have a Reference Exposure Level (REL) assigned to them by OEHHA (see Appendix A, B, and C of OEHHA 2015 Guidance). The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated with acute, 8-hour, or chronic exposure to the pollutant. The Cancer Potency Factor, RELs, and sources commonly associated with the pollutants are summarized in **Table 2: Pollutants of Concern**.

Table 2: Pollutants of Concern

Pollutants	Cancer Potency Slope Factor $(mg/kg\text{-}day)^{-1}$	Acute Reference Exposure Level ($\mu g/m^3$)	8-Hour Reference Exposure Level ($\mu g/m^3$)	Chronic Reference Exposure Level ($\mu g/m^3$)
Benzene	0.1	27	3	3
2-Butanone	-	1,300	-	-
Carbon Tetrachloride	0.15	1,900	-	40
Chloroform	0.019	150	-	300
Chloromethane	-	14,000	-	400
1,2-Dichloroethane	0.072	-	-	400
1,2-Dichloropropane	0.036	-	-	-
Ethylbenzene	0.0087	-	-	2,000
Methylene Chloride	0.0035	14,000	-	400
1,1,2,2-Tetrachloroethane	0.2	-	-	-
Tetrachloroethane (PCE)	0.021	20,000	-	35
Toluene	-	5,000	830	420
Trichloroethylene (TCE)	0.007	-	-	600
o-Xylene	-	22,000	-	700
Vinyl Chloride	0.27	180,000	-	-

1. The reported annual pollutant concentration is at the closest maximally exposed individual resident (MEIR) to the Project Site.

Source: Refer to Attachment A: Modeling Results.

Determining Emission Rates for Pollutants Released during Operation

To analyze the health risk associated with operation of the SVE facility, a multipollutant analysis was conducted based on the SVE tests and the identified pollutants of concern shown in **Table 1.** Pollutant emission rates were calculated with the ideal gas law equation and certain characteristics of the SVE system's discharge stack. An effluent release of each pollutant from the SVE facility was assumed to be greater than the levels observed in the SVE facility test. Then, by assuming the temperature of discharge, pressure of discharge, and rate of discharge, the emission rates for each pollutant were calculated. Specifically, emission rates for each of the pollutants by site was calculated using the following formula:

$$\text{Emission rate} = (ER_t * MW * EDR * L)/(R * P_d * T_d * 10^{-3})$$

Emission Rate = micrograms of pollutant released per minute (µg/minute)

ER_t =	Effluent Rate assumed for the SVE system based on the SVE test (ppmv)
MW =	Molecular Weight of the Pollutant (g/mol)
EDR =	Effluent Discharge Rate from SVE system (500 cubic feet per minute)
L =	Liters per cubic feet (22.32 L/cf)
R =	8. Universal Gas Constant (8.3144 (L*kPa)/(mol*K))
P_d =	Pressure of Effluent Discharge (8.96 kPA)
T_d =	Temperature of Effluent Discharge (333.15 K)

The SVE facility was modeled as a point source in AERMOD based on the stack characteristics described above. The operational emission rate in AERMOD was modeled as unitized (1 gram per second) before being weighted to calculate risk based for each pollutant. Based on the OEHHA methodology, residential inhalation cancer risk from annual average pollutant concentrations are calculated by multiplying the daily inhalation dose, cancer potency factor, age sensitivity factor (ASF), frequency of time spent at home, and exposure duration divided by averaging time, yielding the excess cancer risk. For the modeled source, a 1-hour, 8-hour, and period outputs were modeled with “Other” as a proxy for VOCs.

7.0 Health Risk Analysis

Health Risk Analysis Threshold

Project health risks are determined by examining the types and levels of air toxics generated and the associated impacts on factors that affect air quality. The SCAQMD recommends that the following air pollution thresholds be used by lead agencies in determining whether the impacts from the Project are significant. The thresholds for air toxic emissions included in Rule 1401 are as follows:

- **Cancer Risk:** Emit contaminants that equal or exceed the maximum individual cancer risk of 10 in one million.
- **Cancer Burden:** Emit contaminants that exceeds the cancer burden of 0.5 excess cancer cases (in areas that equal or exceed one in one million).
- **Non-Cancer Risk:** Emit contaminants that equal or exceed the maximum hazard index of 1.0.

Cancer risk is expressed in terms of expected incremental incidence per million population. As noted above, the SCAQMD has established an incremental increase rate of less than 10 in one million as the maximum acceptable incremental cancer risk due to TAC exposure. This risk would be in addition to any cancer risk borne by a person not exposed to these TACs. This threshold serves to determine whether or not a given project has a potentially significant and cumulative impact. To put this risk in perspective, the

existing risk of contracting cancer from all airborne air toxics in the vicinity of the Project Site is 476 in a million which is 55 times more than the SCAQMD's threshold of 10 in one million.[2]

OEHHA established non-carcinogenic risk parameters for use in HRAs that SCAQMD includes in their guidance documents. Noncarcinogenic risks are quantified by calculating a "hazard index," expressed as the ratio between the ambient pollutant concentration and its toxicity or Reference Exposure Level (REL). An REL is a concentration at or below which health effects are not likely to occur. A hazard index of less than 1.0 means that adverse health effects are not expected. Within this analysis, non-carcinogenic exposures of less than 1.0 are considered less than significant.

Potential Health Risk Impacts

Carcinogenic Risk

Table 3: Carcinogenic Risk Assessment shows the health risk for the construction, operation, and combined construction and operation of the Project. Based on OEHHA 2015 Guidance, the exposure duration for a resident is 30 years, beginning with the third trimester in utero, and the worker exposure duration is 25 years, starting in adulthood.

Table 3: Carcinogenic Risk Assessment

Exposure Scenario	Maximum Cancer Risk (Risk per Million)[1]	Significance Threshold (Risk per Million)	Exceeds Significance Threshold?
Construction			
Residential Receptors (Hauling)	3.03	10	No
Residential Receptor (SVE)	2.89	10	No
Residential Receptor (VMP)	1.64	10	No
Worker Receptor (Hauling)	1.34	10	No
Worker Receptor (SVE)	1.95	10	No
Worker Receptor (VMP)	2.99	10	No
Operation			
Residential Receptors	0.19	10	No
Worker Receptor	0.12	10	No
Combined Construction and Operation[2]			
Residential Receptors	3.22	10	No
Worker Receptor	3.11	10	No

1. The reported annual pollutant concentration is at the closest maximally exposed individual resident (MEIR) to the Project Site.
2. Adding the highest maximum cancer risk calculated from construction and operation.

Source: Refer to Attachment A: Modeling Results.

As shown in **Table 3**, the risk at residential and worker receptors would be 3.03 in one million and 2.99 in one million, respectively. The incremental cancer risk would be less than those levels at distances further from the Project Site. As such, the maximum cancer risk would be far below the SCAQMD threshold of 10 in one million.

[2] South Coast Air Quality Management District, *MATES V Estimated Risk*, https://experience.arcgis.com/experience/79d3b6304912414bb21ebdde80100b23/page/Main-Page?views=Cancer-Risk%2CClick-tabs-for-other-data#data_s=id%3AdataSource_105-a5ba9580e3aa43508a793fac819a5a4d%3A247, accessed May 2025.

Non-Carcinogenic Hazard

The significance thresholds for TAC exposure also require an evaluation of non-cancer risk stated in terms of a hazard index. Non-cancer chronic impacts are calculated by dividing the annual average concentration by the REL for that substance. The REL is defined as the concentration at which no adverse non-cancer health effects are anticipated. RELs are designed to protect sensitive individuals within the population. According to OEHHA, the REL for DPM is 5 and the target organ is the respiratory system.[3]

Chronic non-carcinogenic impacts are shown in **Table 4: Chronic Hazard Assessment**. A chronic hazard index of 1.0 is considered individually significant. The hazard index is calculated by dividing the chronic exposure by the reference exposure level. The chronic hazard was calculated based on the highest annual average concentration at the maximally exposed individual receptor. It should be noted that there is no acute or 8-hour REL for DPM and acute and 8-hour health risk cannot be calculated. The highest maximum chronic hazard index associated with DPM emissions from Project construction would be 0.004, 0.051, and 0.049 at the residential, worker, and sidewalk receptors, respectively. Therefore, construction non-carcinogenic hazard would not exceed the acceptable limits of 1.0 and impacts would be considered less than significant. The highest maximum chronic, acute, and 8-hour hazard index associated with operations emissions from SVE facility would not exceed the acceptable limits of 1.0. Therefore, operational impacts would be considered less than SCAQMD thresholds.

Table 4: Chronic Hazard Assessment

Exposure Scenario	Chronic Hazard	Acute Hazard	8-Hour Hazard
Construction			
Residential Receptors	0.004	-	-
Worker Receptors	0.051	-	-
Sidewalk Receptor	0.049	-	-
SCAQMD Threshold	*1.0*	*1.0*	*1.0*
Threshold Exceeded?	**No**	**Not Applicable**	**Not Applicable**
Operation			
Residential Receptors	0.0004	0.0001	0.0002
Worker Receptors	0.0023	0.0003	0.0016
Sidewalk Receptor	0.0025	0.0002	0.0010
SCAQMD Threshold	*1.0*	*1.0*	*1.0*
Threshold Exceeded?	**No**	**No**	**No**

1. The reported pollutant concentration is at the closest receptor (maximally exposed individual receptor).

Source: Refer to Attachment A: Modeling Results.

[3] California Office of Environmental Health Hazard Assessment, *OEHHA Acute, 8-hour and Chronic Reference Exposure Level (REL) Summary*, https://oehha.ca.gov/air/general-info/oehha-acute-8-hour-and-chronic-reference-exposure-level-rel-summary, accessed June 2025.

Conclusion

As described above, impacts related to cancer risk would be less than the applicable SCAQMD significance criteria. Additionally, acute and chronic non-carcinogenic hazards are calculated to be within acceptable limits. It should be noted that the impacts assess the Project's incremental contribution to health risk impacts, consistent with the SCAQMD guidance and methodology. The SCAQMD has not established separate cumulative thresholds and does not require combining impacts from cumulative projects. The SCAQMD considers projects that do not exceed the thresholds to generally not be cumulatively significant.[4] Therefore, impacts related to health risk from the Project would be less than significant.

- - - - - - - - - - - - - - - - - - - - - - -

 ** Model Options Selected:
      * Model Uses Regulatory DEFAULT Options
      * Model Is Setup For Calculation of Average CONCentration Values.
      * NO GAS DEPOSITION Data Provided.
      * NO PARTICLE DEPOSITION Data Provided.
      * Model Uses NO DRY DEPLETION. DDPLETE  =  F
      * Model Uses NO WET DEPLETION. WETDPLT  =  F
      * Stack-tip Downwash.
```

```
      * Model Accounts for ELEVated Terrain Effects.
      * Use Calms Processing Routine.
      * Use Missing Data Processing Routine.
      * No Exponential Decay.
      * Model Uses URBAN Dispersion Algorithm for the SBL for   355 Source(s),
        for Total of    1 Urban Area(s):
   Urban Population =   9757179.0 ;  Urban Roughness Length =  1.000 m
      * Urban Roughness Length of 1.0 Meter Used.
      * ADJ_U*   - Use ADJ_U* option for SBL in AERMET
      * CCVR_Sub - Meteorological data includes CCVR substitutions
      * TEMP_Sub - Meteorological data includes TEMP substitutions
      * Model Assumes No FLAGPOLE Receptor Heights.
      * The User Specified a Pollutant Type of: PM_10

 **Model Calculates  2 Short Term Average(s) of:   1-HR  24-HR
     and Calculates PERIOD Averages

 **This Run Includes:    355 Source(s);       6 Source Group(s); and    1427
Receptor(s)

                with:      0 POINT(s), including
                           0 POINTCAP(s) and      0 POINTHOR(s)
                 and:    355 VOLUME source(s)
                 and:      0 AREA type source(s)
                 and:      0 LINE source(s)
                 and:      0 RLINE/RLINEXT source(s)
                 and:      0 OPENPIT source(s)
                 and:      0 BUOYANT LINE source(s) with a total of     0 line(s)
                 and:      0 SWPOINT source(s)

 **Model Set To Continue RUNning After the Setup Testing.

 **The AERMET Input Meteorological Data Version Date:  16216

 **Output Options Selected:
          Model Outputs Tables of PERIOD Averages by Receptor
          Model Outputs Tables of Highest Short Term Values by Receptor (RECTABLE
Keyword)
          Model Outputs External File(s) of High Values for Plotting (PLOTFILE
Keyword)
          Model Outputs Separate Summary File of High Ranked Values (SUMMFILE
Keyword)

 **NOTE:  The Following Flags May Appear Following CONC Values:  c for Calm Hours
                                                                 m for Missing
Hours
                                                                 b for Both Calm
and Missing Hours
```

```
