CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Administrative Officer Pan,

Hi, my name is Marco Saucedo I'm a local union carpenter out of Carpenters Local 661. Carpenters Local 661 represents over 5,000 working families in the area which include members that live, work, and make use of the businesses in and around the Burbank area. Many construction workers like myself must commute out of the area they live in to work. Most of the times we commute hundreds of miles a day to and from our job site. This increase in vehicle miles traveled contributes to greenhouse gas emissions. The Greenhouse Gas Reduction Plan should require on all construction projects in the city of Burbank the use of a local skilled and trained workforce.

The use of a local skilled and trained workforce can help reduce GHG emissions caused by travel to and from construction sites. Local skilled and trained hire provisions requiring a certain percentage of workers who reside in the area to be employed on construction projects in Burbank will reduce vehicle miles traveled, reduce greenhouse gas emissions, and provide localized economic benefits. Requiring a localized skilled and trained workforce on all projects in the city will decrease the number of commute hours workers from out of the area spend traveling to Burbank. This will also reduce the need for Burbank residents to commute to a jobsite in another area.

In 2021, the Southcoast Air Quality Management found that the inclusion of "use of a local state certified apprenticeship program or a skilled and trained workforce with a local hire component" can result in air pollutant reductions.

In a recent report titled "Putting California on the High Road: A Jobs and Climate Action Plan for 2030" the California Workforce Development Board concluded that "investments in growing, diversifying and upskilling California's workforce can positively affect returns on climate mitigation efforts.

Other cities

in California have not hesitated to apply local skilled and trained workforce requirements for developments in their city.

Requiring a local skilled and trained workforce policy in the Greenhouse Gas Reduction Plan can boost economic development and mitigate transportation and greenhouse gas impacts by minimizing vehicle miles traveled.

Subject: Item No. 2- Greenhouse Gas Reduction Plan

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Administrative Officer Pan,

Hi, my name is ALBERTO Garcia. I'm a local union carpenter out of Carpenters Local 661. Carpenters Local 661 represents over 5,000 working families in the area which include members that live, work, and make use of the businesses in and around the Burbank area. Many construction workers like myself must commute out of the area they live in to work. Most of the times we commute hundreds of miles a day to and from our job site. This increase in vehicle miles traveled contributes to greenhouse gas emissions. The Greenhouse Gas Reduction Plan should require on all construction projects in the city of Burbank the use of a local skilled and trained workforce.

The use of a local skilled and trained workforce can help reduce GHG emissions caused by travel to and from construction sites. Local skilled and trained hire provisions requiring a certain percentage of workers who reside in the area to be employed on construction projects in Burbank will reduce vehicle miles traveled, reduce greenhouse gas emissions, and provide localized economic benefits. Requiring a localized skilled and trained workforce on all projects in the city will decrease the number of commute hours workers from out of the area spend traveling to Burbank. This will also reduce the need for Burbank residents to commute to a jobsite in another area.

In 2021, the Southcoast Air Quality Management found that the inclusion of "use of a local state certified apprenticeship program or a skilled and trained workforce with a local hire component" can result in air pollutant reductions.

In a recent report titled "Putting California on the High Road: A Jobs and Climate Action Plan for 2030" the California Workforce Development Board concluded that "investments in growing, diversifying and upskilling California's workforce can positively affect returns on climate mitigation efforts.

Other cities in California have not hesitated to apply local skilled and trained workforce requirements for developments in their city.

Requiring a local skilled and trained workforce policy in the Greenhouse Gas Reduction Plan can boost economic development and mitigate transportation and greenhouse gas impacts by minimizing vehicle miles traveled.

Local 661 Carpenters Union Member,
Alberto Garcia

Subject: Item No. 2- Greenhouse Gas Reduction Plan

Administrative Officer Pan,

Hi, my name is Jose M Ramirez _ I'm a local union carpenter out of Carpenters Local 661. Carpenters Local 661 represents over 5,000 working families in the area which include members that live, work, and make use of the businesses in and around the Burbank area. Many construction workers like myself must commute out of the area they live in to work. Most of the times we commute hundreds of miles a day to and from our job site. This increase in vehicle miles traveled contributes to greenhouse gas emissions. The Greenhouse Gas Reduction Plan should require on all construction projects in the city of Burbank the use of a local skilled and trained workforce.

The use of a local skilled and trained workforce can help reduce GHG emissions caused by travel to and from construction sites. Local skilled and trained hire provisions requiring a certain percentage of workers who reside in the area to be employed on construction projects in Burbank will reduce vehicle miles traveled, reduce greenhouse gas emissions, and provide localized economic benefits. Requiring a localized skilled and trained workforce on all projects in the city will decrease the number of commute hours workers from out of the area spend traveling to Burbank. This will also reduce the need for Burbank residents to commute to a jobsite in another area.

In 2021, the Southcoast Air Quality Management found that the inclusion of "use of a local state certified apprenticeship program or a skilled and trained workforce with a local hire component" can result in air pollutant reductions.

In a recent report titled "Putting California on the High Road: A Jobs and Climate Action Plan for 2030" the California Workforce Development Board concluded that "investments in growing, diversifying and upskilling California's workforce can positively affect returns on climate mitigation efforts.

In 2021, the Southcoast Air Quality Management found that the inclusion of "use of a local state certified apprenticeship program or a skilled and trained workforce with a local hire component" can result in air pollutant reductions.

In a recent report titled "Putting California on the High Road: A Jobs and Climate Action Plan for 2030" the California Workforce Development Board concluded that "investments in growing, diversifying and upskilling California's workforce can positively affect returns on climate mitigation efforts."

Other cities in California have not hesitated to apply local skilled and trained workforce requirements for developments in their city.

Requiring a local skilled and trained workforce policy in the Greenhouse Gas Reduction Plan can boost economic development and mitigate transportation and greenhouse gas impacts by minimizing vehicle miles traveled.

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Administrative Officer Pan,

Hi, my name is Kevin Jimenez I'm a local union carpenter out of Carpenters Local 661. Carpenters Local 661 represents over 5,000 working families in the area which include members that live, work, and make use of the businesses in and around the Burbank area. Many construction workers like myself must commute out of the area they live in to work. Most of the times we commute hundreds of miles a day to and from our job site. This increase in vehicle miles traveled contributes to greenhouse gas emissions. The Greenhouse Gas Reduction Plan should require on all construction projects in the city of Burbank the use of a local skilled and trained workforce.

The use of a local skilled and trained workforce can help reduce GHG emissions caused by travel to and from construction sites. Local skilled and trained hire provisions requiring a certain percentage of workers who reside in the area to be employed on construction projects in Burbank will reduce vehicle miles traveled, reduce greenhouse gas emissions, and provide localized economic benefits. Requiring a localized skilled and trained workforce on all projects in the city will decrease the number of commute hours workers from out of the area spend traveling to Burbank. This will also reduce the need for Burbank residents to commute to a jobsite in another area.

In 2021, the Southcoast Air Quality Management found that the inclusion of "use of a local state certified apprenticeship program or a skilled and trained workforce with a local hire component" can result in air pollutant reductions.

The use of a local skilled and trained workforce can help reduce GHG emissions caused by travel to and from construction sites. Local skilled and trained hire provisions requiring a certain percentage of workers who reside in the area to be employed on construction projects in Burbank will reduce vehicle miles traveled, reduce greenhouse gas emissions, and provide localized economic benefits. Requiring a localized skilled and trained workforce on all projects in the city will decrease the number of commute hours workers from out of the area spend traveling to Burbank. This will also reduce the need for Burbank residents to commute to a jobsite in another area.

In 2021, the Southcoast Air Quality Management found that the inclusion of "use of a local state certified apprenticeship program or a skilled and trained workforce with a local hire component" can result in air pollutant reductions.

In a recent report titled "Putting California on the High Road: A Jobs and Climate Action Plan for 2030" the California Workforce Development Board concluded that "investments in growing, diversifying and upskilling California's workforce can positively affect returns on climate mitigation efforts.

Other cities in California have not hesitated to apply local skilled and trained workforce requirements for developments in their city.

Requiring a local skilled and trained workforce policy in the Greenhouse Gas Reduction Plan can boost economic development and mitigate transportation and greenhouse gas impacts by minimizing vehicle miles traveled.

Local 661 Carpenters Union Member,

Anthony Perez

Hi, my name is Alex hackler I'm a local union carpenter out of Carpenters Local 661. Carpenters Local 661 represents over 5,000 working families in the area which include members that live, work, and make use of the businesses in and around the Burbank area. Many construction workers like myself must commute out of the area they live in to work. Most of the times we commute hundreds of miles a day to and from our job site. This increase in vehicle miles traveled contributes to greenhouse gas emissions. The Greenhouse Gas Reduction Plan should require on all construction projects in the city of Burbank the use of a local skilled and trained workforce.

Requiring a localized skilled and trained workforce on all projects in the city will decrease the number of commute hours workers from out of the area spend traveling to Burbank. This will also reduce the need for Burbank residents to commute to a jobsite in another area.

In 2021, the Southcoast Air Quality Management found that the inclusion of "use of a local state certified apprenticeship program or a skilled and trained workforce with a local hire component" can result in air pollutant reductions.

In a recent report titled "Putting California on the High Road: A Jobs and Climate Action Plan for 2030" the California Workforce Development Board concluded that "investments in growing, diversifying and upskilling California's workforce can positively affect returns on climate mitigation efforts.

Other cities in California have not hesitated to apply local skilled and trained workforce requirements for developments in their city.

Requiring a local skilled and trained workforce policy in the Greenhouse Gas Reduction Plan can boost economic development and mitigate transportation and greenhouse gas impacts by minimizing vehicle miles traveled.

Administrative Officer Pan,

Hi, my name is fredy martinez I'm a local union carpenter out of Carpenters Local 661. Carpenters Local 661 represents over 5,000 working families in the area which include members that live, work, and make use of the businesses in and around the Burbank area. Many construction workers like myself must commute out of the area they live in to work. Most of the times we commute hundreds of miles a day to and from our job site. This increase in vehicle miles traveled contributes to greenhouse gas emissions. The Greenhouse Gas Reduction Plan should require on all construction projects in the city of Burbank the use of a local skilled and trained workforce.

The use of a local skilled and trained workforce can help reduce GHG emissions caused by travel to and from construction sites. Local skilled and trained hire provisions requiring a certain percentage of workers who reside in the area to be employed on construction projects in Burbank will reduce vehicle miles traveled, reduce greenhouse gas emissions, and provide localized economic benefits. Requiring a localized skilled and trained workforce on all projects in the city will decrease the number of commute hours workers from out of the area spend traveling to Burbank. This will also reduce the need for Burbank residents to commute to a jobsite in another area.

In 2021, the Southcoast Air Quality Management found that the inclusion of "use of a local state certified apprenticeship program or a skilled and trained workforce with a local hire component" can result in air pollutant reductions.
