¹ Non-load related pavement distress refers to the deterioration or damage in pavement that is not caused by traffic loads or vehicle weight. Instead, this type of distress typically results from environmental factors, material properties, construction practices, or other non-traffic-related causes. Examples of non-load related distress include longitudinal/transverse cracks, bleeding, block cracking, and weathering.

² Load-related pavement distress refers to damage or deterioration in pavement that occurs primarily due to the stresses and strains imposed by traffic loads, particularly heavy vehicles. The weight and movement of vehicles, especially trucks and buses, can exert significant forces on the pavement surface, subbase, and subgrade, leading to various forms of structural and surface distress. Some examples include alligator cracking, rutting, and potholes.

Condition Category	PCI Range	Arterials		Collectors		Residentials/Alleyways	
		Treatment	Unit Cost (\$/SY)	Treatment	Unit Cost (\$/SY)	Treatment	Unit Cost (\$/SY)
I (Good to Very Good)	70-100	Do Nothing	\$ -	Do Nothing	\$ -	Do Nothing	\$ -

¹ Non-load related pavement distress refers to the deterioration or damage in pavement that is not caused by traffic loads or vehicle weight. Instead, this type of distress typically results from environmental factors, material properties, construction practices, or other non-traffic-related causes. Examples of non-load related distress include alkali-silica reaction or joint sealing damage

² Load-related pavement distress refers to damage or deterioration in pavement that occurs primarily due to the stresses and strains imposed by traffic loads, particularly heavy vehicles. The weight and movement of vehicles, especially trucks and buses, can exert significant forces on the pavement surface, subbase, and subgrade, leading to various forms of structural and surface distress. Some examples include corner breaks, faulting and punchouts.

Appendix G-1 Resume of Field Inspectors

1 Introduction

The need for quality control is paramount when performing data collection in any field, as it is essential for accurate planning, analysis, and design. NCE's Quality Assurance Management Plan (QAMP) affirms that:

NCE is dedicated to achieving technical and management excellence and to delivering professional engineering and environmental services that meet or exceed our clients' needs. NCE's Quality Assurance/Quality Control (QA/QC) Program is designed to achieve these goals. This QA Management Plan (QAMP) describes NCE's QA Program, which is based on four principles: client satisfaction, employee participation, problem prevention, and continuous quality improvements.

NCE's QAMP establishes minimum quality standards for performance and procedures to ensure our clients receive quality service. It requires the participation of employees at every level. It encourages project managers and technical staff to take pride in their work and assume responsibility for ensuring that the job is done correctly the first time. The QAMP is designed to reduce the incidence of quality-related and, where necessary, results in corrective actions and modification of work procedures to minimize the incidence of future problems.

NCE has also prepared detailed and specific quality control plans (QCPs) for projects; the most notable example is for the **Long-Term Pavement Performance (LTPP) – Western Regional Support Contract** for the Federal Highway Administration. This is a 150-page document that covers data collection on highways, including deflection, profile, pavement distresses, traffic, maintenance and rehabilitation history, materials testing and sampling, and document control.

1.1 Objectives

This document constitutes a formal QCP for the City of Burbank. It was prepared in January 2025. The QCP focuses on data collection issues as part of the pavement management update. Specifically, it is intended for the 2024/2025 Pavement Management Update. The focus is on the collection of network-level pavement distress data. As defined by the National Cooperative Highway Research Program Synthesis 401 Quality Management of Pavement Data Collection, "Network-level data collection involves the collection of large quantities of pavement condition data, which is often converted to individual condition indices or aggregated into composite condition indices."

1.2 Structure

The following components are addressed in this QCP:

- Condition inspection procedures used
- Accuracy required for data collection
- Inspector qualifications and experience
- Safety procedures.

2 Quality Control Plan

2.1 Condition Inspection Procedures

The governing document for performing condition surveys for the City of Burbank is ASTM D6433, “Standard Practice for Roads and Parking Lots Pavement Condition Index (PCI) Surveys.” Both asphalt concrete (AC) and Portland Cement Concrete (PCC) pavements are included in this protocol. The following distresses are collected for each pavement type.

AC Pavements	PCC Pavements
1. Alligator (fatigue) cracking 2. Bleeding 3. Block cracking 4. Bumps and sags 5. Corrugation 6. Depression 7. Edge cracking 8. Joint reflection cracking 9. Lane/shoulder drop-off 10. Longitudinal and transverse cracking 11. Patching and utility cut patching 12. Polish aggregate 13. Potholes 14. Railroad crossing 15. Rutting 16. Shoving 17. Slippage cracking 18. Swelling 19. Raveling 20. Weathering	1. Blowup/Buckling 2. Corner Break 3. Divided Slab 4. Durability Cracking 5. Patching (Large and Small) 6. Linear Cracking 7. Popouts 8. Pumping 9. Punchout 10. Scaling 11. Spalling (Corner and Joint)

Any exceptions to the ASTM procedures will be discussed with the City before any inspections are performed. Exceptions are usually related to distresses or situations that are not covered in the manuals. Examples include slippage cracks, roller checkmarks, or edge cracking on streets with no curbs and gutters. Others include the raveling of surface seals or surveying the open-graded AC mixes. Any modifications will be documented and submitted to the City for approval.

All distress or condition inspections included both windshield and walking surveys based on pre-determined criteria set by the City. The criteria for selecting the appropriate survey method for each pavement section were based on the City’s StreetSaver® projected Pavement Condition Index (PCI) as recorded in the City’s StreetSaver® database. Sections with a PCI between 55 and 70 received a walking survey, while sections with PCI below 55 or above 70 received a windshield survey.

The data will be summarized into sample units and entered into the StreetSaver® database. The size of the sample unit will be 2,500± 1,000 square feet as per ASTM D6433 protocols. In addition, the sample units will match the existing management sections set up in the StreetSaver® database. Before the inspection begins, the NCE team will perform a Field QC by reviewing the pavement condition data collected on the City's pavement network. Since windshield distress data collection differs from the walking protocols, this is required to ensure that the collected pavement data is consistent with those protocols.

Up to 20 pavement sites were selected for quality control purposes. They included a range of:

- Functional Classifications
- Pavement condition or age

An independent NCE technician will select the 20 sites and perform a detailed walking inspection. The windshield team will then perform a blind test on these sites and compare the results.

Acceptability Criteria

The types and severities of the distress must be the same and quantities within ±10% of each other. If corrections are required on more than 10% of the calibration sites, then four additional sites will be selected and compared. This will continue until more than 95% of the calibration sites meet the acceptability criteria.

2.2 Accuracy Required for Data Collection

The accuracy required for data collection has two components, both of which are further described in the following paragraphs.

- Re-inspections
- PCI comparisons with past inspections

2.2.1 Re-Inspection “Check”

At least 5% of all inspections are randomly re-inspected by other team members. A different inspector will review these sites and determine the revised pavement distress measurements. If the initial inspection is determined to be inaccurate, the original inspector is given refresher training before being allowed to continue with any further inspections. Should the data be inaccurate for a particular day, all the data for that day will be re-inspected following refresher training to ensure accuracy.

Acceptability Criteria

At the time of re-inspection, the actual distresses will be re-inspected and verified, and any corrections will be made, if necessary. Distress types and severities must be the same, and re-measured quantities must be within $\pm 10\%$ of the original measured quantity.

If corrections are required on more than 10% of the re-inspected sample units, then an additional 5% will be re-inspected. This will continue until more than 95% of the re-inspected sections meet the acceptability criteria.

2.2.2 PCI Comparisons with Past Inspections

As another level of quality control, the new PCIs are compared with the previous PCIs. These sections are automatically flagged for further investigation if they differ by more than ± 10 PCI points.

If PCI increases 10 points

The section is investigated to see if a maintenance and rehabilitation event has occurred since the last inspection but which has not been recorded. This can only be resolved with feedback from the City. Typically, it may include activities such as:

- Crack sealing activities – changes medium or high severity cracking to low severity
- Patching activities - alligator cracking that has been removed and patched so that the resultant PCI is increased.
- Surface seals
- Overlay

Therefore, an up-to-date maintenance and rehabilitation history file in the StreetSaver® database is desirable, both for historical accuracy as well as to provide additional quality control.

If PCI decreases 10 points

The section is checked to see if the average deterioration rate (usually 3 to 4 points per year) is exceeded. No further action is required if the drop in PCI is within the acceptable range. If the drop exceeds the acceptable range, a re-inspection will be performed. The default performance curves in the pavement management software form the basis for acceptability.

2.3 Inspector Qualifications and Experience

All NCE's inspectors are required to attend formal training on condition distress inspections. For example, any of NCE's inspectors working on the LTPP project are required to attend a week-long training workshop every year to maintain their certifications. The Regional Transportation Commission (RTC) of Washoe County requires inspectors to be calibrated prior to performing any work using the ASTM D6433 protocols (also known as the pavement management inspections).

For pavement management (or ASTM D6433) inspections, NCE's technicians underwent the Orange County Transportation Authority technician prequalification exercise held in January 2022/2023.

Similarly, in agencies that use the StreetSaver® system, NCE's inspectors attend the distress training conducted by the Metropolitan Transportation Commission (MTC). After the formal training, technicians work with an experienced inspector before they are allowed to work on their own. Within the first month of working independently, up to 20% of their work is checked weekly. Any necessary corrections are made immediately.

Finally, NCE conducts a one-day training and calibration workshop annually for all NCE staff involved with data collection. The following table lists the inspectors assigned to this project and their most recent training date.

Inspector Name	Date of Distress Training	Training Conducted by
Joseph de Leon	December 15, 2023	Mei-Hui Lee
Franc Escobedo	December 15, 2023	Mei-Hui Lee
Jonathan Moore	December 15, 2023	Mei-Hui Lee

Resumes of technicians utilized on this project are included in Appendix G1.

3 Safety Procedures

NCE administers a health and safety program in compliance with the Nevada Occupational Safety and Health Act (Section 618.383) and California Occupational Safety and Health Administration (OSHA) Title VIII, Section 3203. The program is documented in NCE's Workplace Safety Program Manual, which can be provided upon request.

Generally, the safety procedures include:

- Inspectors wear a Class 2 safety vest at all times.
- Flashing beacons are placed on all vehicles utilized for inspections.
- Stopped vehicles are to be parked at locations away from moving traffic (nearby parking, shoulders, etc.).
- For streets with higher volumes of traffic, inspectors usually use the sidewalk and move in the face of traffic when conducting the survey. This will give them more time and better chances of escaping a dangerous situation involving incoming vehicles.

On streets where there is a high volume of traffic or high speeds, additional measures may be necessary, such as:

- Inspections occur during off-peak periods or on weekends.
- An additional inspector attends to watch out for traffic.
- Traffic flaggers are provided in extreme cases.

In extreme cases where walking on the pavement surface is impossible, inspections will be performed from sidewalks or raised medians. However, this is extremely rare for city or county roads/streets; this is most often encountered on state highways, and lane closures are the most likely option in that circumstance.

All NCE inspectors are required to take online safety programs annually as administered by

“Click Safety.” These classes include:

- Work zone Traffic Safety Tips for Construction.
- Cal Heat Illness Prevention for all Industry Workers.
- Cal Person Protective Equipment for Construction.

Appendix G-1

Resume of Field Inspectors

Appendix G-1 Resume of Field Inspectors

Franc Escobedo – Senior Field Technician

Franc has more than 22 years of experience as a pavement management technician for NCE. He has performed numerous pavement condition inspections throughout California, Idaho and Washington. His experience includes distress collection across various pavement management systems, including the Metropolitan Transportation Commission StreetSaver®, PAVER™, Cartographs, and Hansen systems. Additionally, Franc has completed both the OCTA PAVER™, and MTC “Distress Identification” courses for both asphalt concrete and portland cement pavements and now assists with the training of agency staff on both courses.

Franc performs all activities relating to pavement data collection using hardcopy forms or tablets. As part of the quality control process, he performs cross-checks of data in the PMS database. He regularly performs quality control checks of field collected data and pavement maintenance history to ensure that PMS databases are accurate and up-to-date. During this process, he generates detailed reports that are necessary to perform his cross-checks of the collected data.

Representative Projects

County of Orange Program Management System Updates *Orange County, CA*

Engineering Technician. Pavement distress surveyor. Scope includes verifying the road inventory for a road network (674 centerline miles), surveying the roads using ASTM D6433-11 protocols, updating the maintenance history, developing maintenance strategies, performing multiple budget scenarios, linking to a GIS shapefile, developing a seven-year work plan, and preparing reports. Concurrent with the pavement condition survey, mobile data collection units gathered high-resolution 360-degree geo-referenced right-of-way street level digital imagery along with 3D point cloud data. Assets collected included markings, signs, curb ramps, signals, and drainage features. Work provided from 2009-2020. Project cost: \$2.3 million.

As-Needed Pavement Condition Survey Services, APE15117

City and County of San Francisco, CA

Engineering Technician. Pavement distress surveyor. Since 2016, NCE performed condition surveys on almost 1,000 centerline miles of streets. A particular challenge in 2016 and 2017 was the change in distress protocols when weathering and raveling were split into two different distresses; this resulted in an increase of the PCI, further confirmed by a research study. Project cost: \$868,796.

Pavement Management System Updates *City of Berkeley, CA*

Engineering Technician. Pavement distress surveyor. NCE is updating StreetSaver® and providing a five-year paving plan for 2018 – 2022. For the first four years the City will select streets for treatment based on criteria identified under Measure M. Project cost: \$49,900.

Pavement Management Update

Sonoma County, CA

Engineering Technician. Pavement distress surveyor. The scope included updating existing pavement management system annually, developing pavement treatment strategies, conducting budgetary analysis, and providing non-pavement needs assessment. Project cost: \$823,981.

As-Needed Pavement Engineering Services, San Francisco International Airport (SFIA)

City and County of San Francisco, CA

Engineering Technician. Pavement distress surveyor. Since 2011, NCE has provided on-call pavement consultant services on a very complex airfield environment under tight security, conducted forensic analysis on the PCC apron areas, and implemented the PAVER™ PMS. NCE performed the pavement designs for Runway 10R-28L, Plot 40, and Plot 12, determined the structural adequacy and performed mechanistic pavement designs using FAARFIELD for Runways 1L/19R and Taxiways E, F, and L. Determined the ACN/PCN for all runways and taxiways. NCE conducted forensic analysis on a new taxiway exhibiting premature large-scale reflective block cracking and rutting at Boarding Area A and dimpling of Taxiways B and M. NCE designed a high stability asphalt concrete mix to solve this problem. Updated the PAVER™ Airport PMS and performed automated distress surveys as per ASTM D5340. Digital images were collected, and the information was used to update SFIA's GIS and asset management system. Prepared final reports on the funding and maintenance needs for the next 20 years for the Federal Aviation Administration. NCE is currently providing similar pavement services to SFIA as a subconsultant through 2022. Project cost: \$1.2 million.

Appendix G-1 Resume of Field Inspectors

Joseph DeLeon – Senior Field Technician

Joseph joined NCE in 2017 as a pavement management technician and is experienced in collecting distress data for pavement management systems. Apart from conducting field inspections, he has performed all functions related to data collection and is an active participant in the quality control process. As part of this process, he performs cross-checks of data in the PMP database. Joseph has performed quality control checks of field collected data and pavement maintenance history to ensure that PMP databases are accurate and up-to-date. During this process, he generates detailed reports, needed to help perform his cross-checks of the data collected.

Representative Projects

Automated Survey / Control Sections

City of San Clemente, CA

Field Technician. Drove automated rig to conduct automated survey on residential roads and arterials in San Clemente, followed by inspection of control sections.

Orange County Automated Survey

City of Dana Point, County of Orange, CA

Field Technician. Drove automated rig to conduct automated survey on residential roads and collectors in Dana Point, Las Flores, North Tustin and Rossmoor.

Automated Survey / Control Sections

City of Manhattan Beach, CA

Field Technician. Drove automated rig to conduct automated survey on residential roads and arterials in Manhattan Beach, followed by inspection of control sections.

Pavement Management Systems

City of Newport Beach, CA

Field Technician. Collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Conducted windshield inspections on residential, collector and alleyways in Newport Beach.

Distress Data Quality Control

City of West Covina, CA

Field Technician. Collecting distress data for AC/PCC surfaces according to the ASTM19/20 system. Conducted quality control on arterials and collectors in West Covina.

Appendix G-1 Resume of Field Inspectors

Jonathan Moore – Field Technician

Jonathan joined NCE in 2022 as a pavement management technician and since then, has gained in-depth knowledge and expertise in collecting distress data and coring samples for pavement management systems. Apart from conducting field inspections, Jake performs all functions related to data collection and is an active participant in the QC process, including crosschecks of data in the PMS database, quality control checks of field collected data and pavement maintenance history to ensure that PMS databases are accurate and up to date.

Representative Projects

2022-2023 Pavement Management Updates

City of Anaheim, CA

Field Technician. The City has approximately 584 centerline miles and NCE has been assisting the City with updating the PMP since 2013 including transitioning from PAVER™ to StreetSaver®. Jonathan is assisting with performing distress/condition surveys; collecting both ride quality (International Roughness Index) and digital images of the pavements; identifying missing sidewalk gaps; QC; updating the M&R history; creating shapefiles and KML files with the pavement condition information; performing funding and budget scenarios; and providing reports and submittals to OCTA.

2022 PMP Update

City of Lemon Grove, CA

Field Technician. NCE is reviewing all public roadways within the City, evaluating and updating the City's existing Pavement Management Program (PMP), updating existing software used to manage the PMP, provided a capital improvement program (CIP), and CIP budget for the next five years. Jonathan is assisting with updating the City's database with a field survey from a mechanical and/or visual inspection of each pavement section's surface distress information and includes surface and subsurface analysis to quantify the street conditions.

As-Needed Consultant Services for Pavement Management and Road Surveying

County of San Diego, CA

Field Technician. Covering an area of nearly 1,500 square miles, the County maintains approximately 1,950 centerline miles of roadways. The network is comprised of approximately 1,843 centerline miles of asphalt concrete roadways, with the remainder being exposed cement concrete or unpaved disintegrated granite.

Work/Experience Prior to NCE

Los Angeles Department of Water and Power/Osmose Utility Services, Peachtree City, GA

Utility Pole Inspector/Field Technician. Jonathan performed field inspections of utility poles for structural and electrical errors. He logged information into the system and the data was transferred from the IT department to Los Angeles Department of Water and Power, who would send out a crew to mitigate damages and/or potential hazards. During inspections, Jonathan would also utilize measuring equipment and photographed the condition of the poles.

Hampton Tedder Electric Company, Commerce, CA

Quality Control/ Data Entry Technician. Jonathan assisted in transitioning the company's previous paperwork to a digital database. He served as a liaison between different company locations for the Inspectors and foremen from the North and
